

Make AI spend an executive decision

Fabric + Foundry tokenomics
For a global semiconductor enterprise

Visibility → governed action → billed savings

Turn visibility into measurable savings

\$1.05m

Net savings / month

\$1,054,400 at steady state

\$12.65m

Annual net run-rate

\$12,652,800 at steady state

\$10.32m

Year-one net benefit

\$10,321,200 after ramp + setup

Planning case: \$5m/month in-scope AI consumption

Approve only quality-safe optimizations. Finance validates realized savings against invoices.

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Source: illustrative model; exact assumptions and figures on slide 14.

Match AI economics to business outcomes

Engineering copilots

Right-size routine requests; preserve code quality and latency.

Manufacturing troubleshooting

Spot retry loops and anomalous spend; protect critical response quality.

Supply-chain analytics

Forecast consumption by BU; prioritize value over token volume.

Source: proposed semiconductor use cases; not claims about Micron deployments.

Normalize once. Compare across providers.

Price history enriches Gold facts; retain provenance and reconcile normalized usage to bills.

Source: repository overview + proposed telemetry ingestion; see notes.

Govern tools. Correlate every request.

Proposed APIM-mediated route—not the automatic path of the native Fabric tool integration.

Source: Microsoft Learn—Foundry, Fabric data agent and APIM monitoring; see notes.

Give leaders three decision surfaces

Source: proposed serving design; Fabric agent integration preview constraints in notes.

Convert insights into approved actions

Forecast + budget risk

Finance sees forecast variance

Adjust BU envelopes—not quality targets.

Efficiency + model selection

Owners compare cost per good answer

Test smaller models and cache-safe prompts.

Anomalies + quota management

Operations flags anomalies

Approve caps, alerts or rollback.

Agent ROI

Leaders compare value by workload

Fund use cases with proven outcomes.

Insight / recommendation / approval / quality test / invoice reconciliation

Source: repository-described ML capabilities; proposed decision and approval design.

Three levers. One nonoverlapping model.

Monthly benefit builds sequentially—not 12% + 8% + 5%.

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Source: illustrative sequential savings model; planning baseline \$5m/month.

Monthly value scales with AI consumption

Net/month: \$180,880 • \$1,054,400 • \$2,158,800

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Source: illustrative model. Equal optimization rates; varying spend and platform costs.

Annual value is a run-rate

Net/year run-rate: \$2,170,560 • \$12,652,800 • \$25,905,600

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Source: illustrative model. Equal optimization rates; varying spend and platform costs.

From dashboard to governed decision

\$5.00m

In-scope monthly baseline

23.088%

Modeled gross opportunity

\$1.05m

Modeled net / month

BU decision queue

Engineering	Test lower-cost model on routine tasks
Manufacturing	Review retry anomaly before changing limits
Supply chain	Compare forecast demand with BU budget

Decision readiness

Quality test needed
Approval required
Savings unverified

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Illustrative management UI concept • Simulated recommendations, not observed customer results.

Protect identity, data and decision quality

Identity follows the user

OBO / delegated access.
Same tenant; scoped data access.

Telemetry is intentional

Caller hash, BU and request ID.
No secrets or prompt bodies.

Data stays within boundaries

Least privilege and scoped datasets.
Validate capacity region and retention.

Savings must preserve quality

Human approval and rollback controls.
Reconcile accepted changes to bills.

Preview gate: validate supported auth, tenant, capacity region and tool path before commitment.

Source: Microsoft Learn preview requirements + proposed controls; see notes.

Approve a measured pilot—not a promise

Days 1–30

Baseline

FinOps: reconcile bills; confirm access.

Days 31–60

Controlled test

Engineering: test one workload.

Days 61–90

Value validation

Finance + BU: approve changes; verify bills.

Decision today: name a BU sponsor, provide 90 days of spend data, and authorize a bounded pilot.

Source: proposed 90-day validation plan; timing is illustrative.

Michael Yaacoub | Sr Solution Engineer

Make the financial assumptions auditable

Planning input / result	Lower spend	Planning case	Higher spend
AI consumption / month	\$1,000,000	\$5,000,000	\$10,000,000
Gross savings / month	\$230,880	\$1,154,400	\$2,308,800
Platform cost / month	\$50,000	\$100,000	\$150,000
Net savings / month	\$180,880	\$1,054,400	\$2,158,800
Net annual run-rate	\$2,170,560	\$12,652,800	\$25,905,600
One-time setup	\$300,000	\$600,000	\$900,000
Year-one net after ramp	\$1,524,240	\$10,321,200	\$21,542,400

Gross = $S \times (1 - .88 \times .92 \times .95)$ | Year one = $10.5 \times \text{gross} - 12 \times \text{platform} - \text{setup}$

Illustrative planning assumptions — not Micron spend, Microsoft pricing quotes, or guaranteed savings

Source: illustrative model. Dollars USD; savings are not verified customer economics.

Separate evidence from planning assumptions

Repository concept

Usage facts, price provenance and ML outputs.
Not production-validated.

GitHub: [FabricIQ-FoundryIQ-CostOps-Docs](#)

Fabric integration

Delegated tool access and observability.
Validate preview limits before commitment.

Microsoft Learn: [Fabric agent tool + observability](#)

APIM monitoring

Gateway logs can reach Log Analytics.
Caller attribution requires configuration.
